# Dark Mode

`userChrome.css`:

```
/* Remove New Tab Flash */
@-moz-document url(chrome://browser/content/browser.xul)
{
  browser[type="content-primary"], tabbrowser tabpanels, #appcontent > #content
  {
background: #323234 !important;
  }
}
#tabbrowser-tabpanels {
  background: var(--toolbar-bgcolor) !important;
}
```

`userContent.css`:

```
@-moz-document url(about:blank),
   url(about:newtab)
{
  #newtab-window,
  html
  {
background: #323234;
  }
}

@-moz-document url-prefix(about:blank), url-prefix(about:newtab), url(moz-extension://db85f1de-ba17-4b39-8a06-7e124677ffd6/html/newtab.html) { html:not(#ublock0-epicker), html:not(#ublock0-epicker) body, #newtab-customize-overlay { background: #323234 !important; } }
```

The last line in `userContent.css` is to darken the page before the loading of new tab override. To get the weird id looking string, go to the settings of new tab override and look at the url.
